
Electronic locks

E4000 / E4000R / E6000R

Options

General code

A 9-digit general code with up to 9 different 6- to 8-digit standard codes for entering of hierarchal access structures (e.g. for management executives and heads of department).

Two-person operation

In order to open the protected area, two independent, 6- to 8-digit secret codes have to be entered.

VdS-blocking device

The lock can be blocked by external sensitizing from the alarm system. The blocking device is available as factory mounted or as retrofitting set.

Access timer

If designed as a seven-day switch, access to the locking system can be limited to certain pre-set times. The timer offers eight independent settings for single days or groups of days.

Manipulation alarm

In the event of unauthorized operation, a certain number of unsuccessful opening attempts will result in an electric alarm signal suitable for evaluation.

Hold-up code alarm

Besides a standard code, this lock has a 6- to 8-digit hold-up code, which provides access to the protected area like the standard code, but in addition produces an electric alarm signal. It can be supplied with the "delayed opening" feature.

Shape of bolt

In order to better adapt the lock to specific user requirements, our locks can be supplied with different shape bolts.

Operating panel surface

We also offer metal plated operating panels. Available are bright and bright chromium platings, bright gold platings and bright ruthenium platings.
