

Electronic locks

E2000 / E4000 /E6000

Electronic module (version 5.2)

Our electronic locking systems are fitted with electronic modules produced according to the advanced SMD manufacturing technique. They are mounted inside the protected area. The modules are connected to the external control panel by means of an 8 mm (diameter) electric cable (please note: in some cases, boxouts through the wall of a safe or strongroom of more than 100 mm² are not permitted). Communication with the system components is via miniature plugs:

- ST1: 12-pole, connects to the keypad
- ST2: 2-pole, connects to the locking assembly
- ST3: 10-pole, connects to the optional access timer and any other system components
